Table of Contents

Neotree Skip Logic: Variables Affected and Clinical Rationale

Generated from all Neotree script JSONs in key_dictionary/neotree_scripts/ (Zimbabwe and Malawi). Total field keys with field-level skip conditions: **367**, organised into 15 clinical groups.

What is skip logic?

Skip logic (also called conditional display) means a field is only shown on screen when a prior answer satisfies a specified condition. If the condition is not met, the field is hidden and the clinician never enters a value. In the cleaned dataset these fields become NA. This NA is **intentional and structurally meaningful** – it is coded as -7 (Not Applicable) in the NA-reason module (Module 16).

Condition syntax

Syntax element	Meaning
\$FieldKey	Value of a previously answered field
= 'value'	Equals (case-sensitive string match)
!= 'value'	Does not equal
and / or	Logical AND / OR
!\$Field = 'val'	Negation prefix
true / false	Boolean values

Group 1: Dumpsite / unknown-origin baby

Fields affected: 64

Clinical rationale: DU = Dumpsite: baby found abandoned with no history. Maternal/birth history fields are structurally inapplicable.

Group 2: Brought In Dead (BID) – outcome routing

Fields affected: 37

Clinical rationale: BID = Brought In Dead: the baby arrived at the facility already deceased. The form routes to a specific set of fields for BID cases, hiding fields that are only relevant for live admissions (e.g. treatments, feeding, follow-up). This is the most frequent source of -7 codes after dumpsite cases.
